

Fiber Optic Transceiver 1 Optical 1 Electrical Single Mode

Overview

A single mode SFP transceiver is a hot-swappable optical module designed to transmit and receive data over single mode fiber (SMF). It is commonly used in Ethernet and fiber optic networking equipment such as switches, routers, and media converters. By converting electrical signals into optical signals—and vice versa—SFP. With its fixed configuration, deployments are just plug-and-play, The Fiber optical supports both multimode (SX) or single-mode.

Improve safety, signal integrity, and reliability by using two optical fibers instead of wire to transfer bidirectional serial data using single-mode optical fiber.

Fiber optic transmission systems (datalinks) all work similar to the diagram shown above. They consist of a transmitter on one end of a fiber and a receiver on the other end.
