

How to stack optical ports on a switch

Overview

For stacking, use only Cisco-certified StackWise cables (do not reuse 3750 or non-matching cables). Switch stacking is a feature of certain Cisco access layer switches which allows for the creation of a single logical device from many individual devices via a backside stack port connected by several stack cables. Stackable switches logically to become one switch. The major benefits of stacking. Approved stacking for av is a two-switch stack for redundant core. When the switches are stacked all multicast traffic is flooded through the stack. PTP TC is not supported within a Stack. This ensures simplified management, enhanced redundancy, and greater flexibility in port distribution and bandwidth utilization.

How to stack optical ports on a switch

Switch stacking through optical modules can achieve high network reliability, large network data forwarding, and simplified network management.

We will first configure the ports that we want to use for stacking and then power down the switches and connect the stacking ports, then we will power up the switches and verify they are stacked.
