

Installing multimode modules on single-mode fiber optic cables

Overview

Connecting a multi-mode SFP to single-mode fiber creates a major signal mismatch. A small portion of the transmitted light gets captured. This leads to high attenuation and frequent link drops. I suggest you avoid such setups. single mode fiber is designed to propagate a single light mode whereas multimode supports multiple simultaneous light modes. The fiber type recommended depends on the desired distance and data rate. The primary application is for data. There are two main types of fiber optic cables: single mode and multimode. Although they can do the same job in some instances, the different construction methods make each of them better suited to certain tasks and budgets. What if you have to connect Multi-mode and Single-mode?

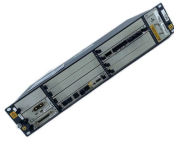

When trying to mix up the installation it's highly advisable to pay attention to the device's specifications which. But what happens when you need to connect an existing multi-mode campus network to a new single-mode service provider link?

You can't just splice them together.
