

Low-voltage switchgear usually needs to be equipped with a small busbar

Overview

Inside low-voltage switchgear, busbars form the main power distribution backbone. They connect the main incoming supply to various protective devices like circuit breakers or fuse disconnectors. Typical ANSI/NEMA (American National Standards Institute, National Electrical. LV panels are metal-enclosed switchgear that provides a three-phase power distribution to supply electric power at voltages up to 1000 volts, current up to 10000 amps, and a frequency of 50HZ or 60HZ. A busbar is a metal bar, usually made of copper or aluminum, that carries electricity inside switchgear. These devices operate at voltages below 1,000 volts (V).
