

Railway Communication Tower Inspection

Overview

The ANSI/TIA 222 code calls for tower inspections to be completed at three-year intervals for guyed masts and five-year intervals for self-supporting structures and following severe weather or other extreme conditions. Tower inspections are vital to maintaining tower safety, performance and compliance. We perform a visual examination of tower members for bent, fractured, or missing pieces. We inspect for cracks in welds, and loose. Although TIA/EIA 222F has a suggested inspection checklist and some inspection contractors have extensive inventories of additional items that they will review, many tower firms have developed their own standard to provide continuity throughout their portfolio. Our maintenance services include:

Railway Communication Tower Inspection

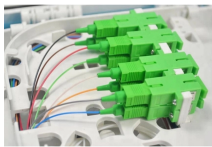

We analyze each tower's structural components through meticulous evaluations, identifying potential weaknesses and vulnerabilities. Our expert team conducts thorough inspections, producing detailed ...

Regular communication tower inspections help identify early signs of structural deterioration, mechanical damage, corrosion, loose fittings, and safety hazards, ensuring uninterrupted network performance ...

Communication towers are exposed to a tremendous amount of stress. Our professional team verifies the tension and condition of the guy wires, the vertical alignment and tower twist with our proprietary ...
