

Red in the middle of the bundled tail fiber

Overview

The tail creates a conduit between the phage capsid and host cytoplasm and allows the phage particle to remain attached to the cell surface. Such phages are known as the tailed bacteriophages or Caudovirales (Fig. Bundle tail fibers, also known as ribbon fibers, are multiple fibers that are aligned and bonded together in a ribbon-like shape. Perfect for fast, error-free termination in your ODF or splice closures. Available in OS2/OM3/OM4 at factory-direct wholesale pricing. How to Identify Fibers in. At the first step of phage infection, the receptor-binding proteins (RBPs) such as tail fibers are responsible for recognizing specific host surface receptors. In the photos above, on the left is a 1728 fiber cable with color coded buffer tubes, in the center are (from the top) singlemode zipcord cable used for patchcords with each fiber color coded, and on the right, a yellow.

Siphophages, accounting for ~60% of known phages, bear a long, flexible tail that allows host recognition and safe delivery of the DNA from the capsid to the cytoplasm of the infected cell.

Color codes make it easy to identify these patchcords which all have SC connectors: aqua cable and connector indicate 50/125 laser optimized fiber on the cable to the left. In the center, orange cable ...
