

The optical module was replaced

Overview

CPO packages silicon photonics devices with ASICs, and is about to replace traditional pluggable optical modules, improving energy efficiency by 3.5 times and deployment speed by 1. Optical modules typically have an electrical interface on the side that connects to the inside of the system and an optical interface on the side that connects to the outside. Optical modules are hot swappable, and you do not need to power off the device when replacing optical modules. If an. With 400G modules now the baseline, 800G adoption is surging—especially across AI and hyperscaler environments—while 1.6T modules edge closer to reality. As illustrated in the Optical Module. At present, the world's AI large-scale models have been released one after another and combined with industry applications to promote the smart upgrade of thousands of industries, and continue to drive the demand for optical chips, optical devices, and optical module in the upstream of the data.
