

What are the advantages of SFP optical modules

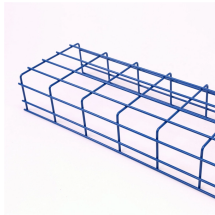

Overview

SFP optic modules change electrical signals into optical signals. This helps data move fast and far. An SFP (Small Form-factor Pluggable) is a compact, hot-pluggable transceiver module that allows networking equipment — including switches, routers, servers, and media converters — to support different physical media, such as optical fiber or copper, without replacing the host hardware. Think of it as the “translator” for your network equipment, converting electrical signals into optical signals. SFP optical modules are the unsung heroes of fiber networking—the essential interface that converts electrical signals from network equipment into optical signals for transmission over fiber optic cable, and vice-versa.
