

What are the potential hazards of fiber optic cables in computer rooms

Overview

While they don't carry electrical current, they can still pose hazards if technicians overlook cabling safety. Glass strands can splinter, lasers can damage eyes, and improper handling can compromise network performance. Unlike traditional copper cables, fiber optics involve materials that can cause injury if mishandled and require stricter procedures during installation, preparation, and disposal. Whether you're a technician in the field or managing a facilities upgrade, understanding the risks and proper. One of the primary concerns when handling fiber optic cables is the tiny glass strands they contain. Good practices begin with recognizing the real risks. Fiber optic cable is not as dangerous as a live cable. There is no risk of electrocution, no magnetic field, no radio waves.
